23b.	C
24a.	parallelogram
24b.	rhombus and parallelogram
24c.	rectangle and parallelogram
24d.	none of the figures
25a.	 <p>Justification: Congruent circles were constructed with centers at points A and B, therefore, since radii of congruent circles are congruent, $\overline{AC} \cong \overline{BC} \cong \overline{AD} \cong \overline{BD}$. Therefore $ABCD$ is a rhombus. In the rhombus, the diagonals are perpendicular, therefore $\overline{AB} \perp \overline{CD}$. Since $ABCD$ is a parallelogram the diagonals bisect each other. Therefore $\overline{AE} \cong \overline{EB}$, so \overline{CD} is the perpendicular bisector of \overline{AB}.</p>
25b.	 <p>Justification: $\overline{AB} \cong \overline{BC}$ since they are the radii of the same circle. $\overline{AD} \cong \overline{DC}$ since they are constructed using the same compass setting. $\overline{BD} \cong \overline{BD}$ by the reflexive property of congruence. Therefore $\triangle ABD \cong \triangle CBD$ by SSS. $\angle ABC \cong \angle CBD$ by CPCTC, and by the definition of angle bisector \overline{BD} bisects $\angle ABC$.</p>

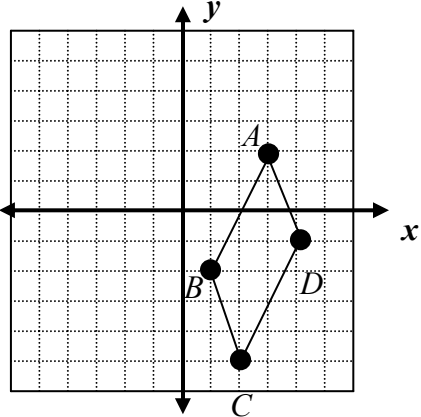

<p>25c.</p>	 <p>Justification: $\overline{AB} \cong \overline{CE}$, $\overline{AD} \cong \overline{CF}$ since they were drawn by the same compass setting. $\overline{BD} \cong \overline{EF}$ since they were drawn with the same compass setting. Therefore $\triangle BAD \cong \triangle ECF$ by SSS. Therefore $\angle BAD \cong \angle ECF$ by CPCTC. Finally by the converse of the corresponding angles postulate, $\overline{CF} \parallel \overline{AD}$.</p>
<p>25d.</p>	 <p>Justification. I drew segments between A and B and B and C. I constructed the perpendicular bisector of \overline{AB}. Every point on that line is equidistant from points A and B. I constructed the perpendicular bisector of \overline{BC}. Every point on that line is equidistant from points B and C. Therefore, point D, the intersection of those two perpendicular bisectors, is equidistant from points A, B, and C.</p>
<p>26.</p>	<p>540 degrees</p>
<p>27.</p>	<p>156 degrees</p>
<p>28.</p>	<p>40 degrees</p>
<p>29.</p>	<p>8 sides</p>
<p>30.</p>	<p>6 sides</p>
<p>31.</p>	<p>Charlie is correct. The basic rotational symmetry is 360 degrees divided by the number of sides. $360 \div 6 = 60$, so any multiple of 60 degrees will work.</p>

32.

- $C'(3, 2), C''(3, -2)$
- $P''(x, y) = (-x, y - 4)$ The reflection across the y -axis makes the x -coordinate the opposite, while the translation downward subtracts 4 from the y -coordinate.

43d.	Deductive reasoning	
43e.	Inductive reasoning	
44.	 <ul style="list-style-type: none"> The quadrilateral is a parallelogram. The slopes of \overline{AB} & \overline{CD} equal 2, so $\overline{AB} \parallel \overline{CD}$. The slopes of \overline{AD} & \overline{BC} equal -3, so $\overline{AD} \parallel \overline{BC}$. The quadrilateral is not a rectangle or a square, since the slopes of \overline{AD} & \overline{CD} are not opposite reciprocals (do not have a product of -1). The quadrilateral is not a rhombus since the slopes of the diagonals are not opposite reciprocals. $m_{\overline{BD}} = \frac{1}{3}, m_{\overline{AC}} = 7$. 	
45a.	3 parallelograms	
45b.	$(-1, -1)$, $(3, 3)$, and $(-5, -1)$	

46.	The triangle is a right triangle. $m\overline{AB} = \frac{2}{7}, m\overline{AC} = -\frac{7}{2}$. So $\overline{AB} \perp \overline{AC}$.														
47.	A 2-column proof is given.
