

Name:

Sail into Summer with Math!

For Students Entering Math A

This summer math booklet was developed to provide students in kindergarten through the eighth grade an opportunity to review grade level math objectives and to improve math performance.

Summer 2007

Student Responsibilities

Students will be able to improve their own math performance by:

- Completing the summer math booklet
- Reviewing math skills throughout the summer.

Student Signature

Grade

Date

Parent Responsibilities

Parents will be able to promote student success in math by:

- Supporting the math goal of the cluster of schools,
- Monitoring student completion of the summer math booklet,
- Encouraging student use of math concepts in summer activities.

Parent Signature

Date

Write Numbers in Words and Digits

Hints/Guide:

In order to read numbers correctly, we need to know the order of each place value. The order is the following:

1,000,000 is one million
10,000 is ten thousand
100 is one hundred
1 is one
0.01 is one hundredth

100,000 is one hundred thousand
1,000 is one thousand
10 is ten
0.1 is one tenth
0.001 is one thousandth

So, the number 354.67 is read as three hundred fifty four and sixty-seven hundredths and 3,500,607.004 is read as three million, five hundred thousand, six hundred seven and four thousandths. Please remember that the word "and" indicates and location of the decimal point in mathematics and should not be used anywhere else (for example, it is inappropriate to read 350 as three hundred and fifty, because "and" means a decimal point). Also, the term "point" in mathematics is a geometry term and should not be used in naming numbers (for example, 3.5 is not three "point" five, but rather three and five tenths).

Exercises:

Write the number name:

- 1. 560.08 _____
- 2. 7.016 _____
- 3. 24.47 _____
- 4. 6,003 _____
- 5. 3,005,600.07 _____

Write the number the name represents:

- 6. Forty-five thousandths _____
- 7. Seventeen and seven hundredths _____
- 8. Five million, three hundred thousand,
twenty-nine and six tenths _____
- 9. Six million and five thousandths _____
- 10. Two hundred eight thousand, four _____

Order Decimals

Hints/Guide:

To compare decimals and list them from least to greatest, it is easier to compare decimals that are the same place value, so one process we can use to compare decimals is to include trailing zeros to make all of the decimals that same place value. For example, to put the following in order from least to greatest:

.3, 1.61, .006, .107 is easier to compare as:
0.300, 1.610, 0.006, 0.107
to achieve 0.006, 0.107, 0.300, 1.610
and then return to the original form: 0.006, 0.107, 0.3, 1.61

Exercises:

List each group of numbers in order from least to greatest:

1. 20, 4, .6, .08

2. 246.8, 248.6, 244.9, 246.5

3. 1.03, 2.4, .89, .987

4. 14.8, 2.68, .879, 8.47

5. 5.3, 5.12, 5.38, 5.29

6. 54.89, 56.3, 58.1, 52.98

7. 4, .006, .8, .07

8. 297, 3.456, 64.4, 7.24

9. 794, 793.8, 794.65, 794.7

10. 9, 6.7, 7.24, 14

11. 4.2, 4.19, 4.07, 4.3

12. 3.75, 6.7, 3.8, .45

Add and Subtract Whole Numbers

Hints/Guide:

The key in adding and subtracting whole numbers is the idea of regrouping. If a column adds up to more than ten, then the tens digit of the sum needs to be included in the next column. Here is an example of the steps involved in adding:

$$\begin{array}{r} 1 \\ 346 \\ + 157 \\ \hline 3 \end{array} \quad \text{to} \quad \begin{array}{r} 1 \\ 346 \\ + 157 \\ \hline 03 \end{array} \quad \text{to} \quad \begin{array}{r} 346 \\ + 157 \\ \hline 503 \end{array}$$

Because $6 + 7 = 13$, the 3 is written in the ones digit in the solution and the 1 is regrouped to the tens digit. Then, $1 + 4 + 5 = 10$, the 0 is written in the tens digit of the solution and the 1 is regrouped to the hundreds place of the problem. Finally, since $1 + 3 + 1 = 5$, the solution is 503.

For subtraction, regrouping involves transferring an amount from a higher place value to lesser place value. For example:

$$\begin{array}{r} 31 \\ 346 \\ - 157 \\ \hline 9 \end{array} \quad \text{to} \quad \begin{array}{r} 213 \\ 346 \\ - 157 \\ \hline 89 \end{array} \quad \text{to} \quad \begin{array}{r} 2 \\ 346 \\ - 157 \\ \hline 189 \end{array}$$

Because 7 cannot be taken from 6 in the set of whole numbers, we must regroup 1 ten to create $16 - 7$, which is 9. Then, since we have taken 1 ten, the 4 has become 3, and we must take 1 from the 3 to create 13, and $13 - 5 = 8$. Finally, we have 2 hundreds remaining, and $2 - 1 = 1$, so the solution is 189.

Exercises: Solve:

No Calculators and show work !

1.
$$\begin{array}{r} 6,496 \\ 4,113 \\ + 3,608 \\ \hline \end{array}$$

2. $54,398 + 64,508 =$

3.
$$\begin{array}{r} 3,254 \\ 754 \\ + 690 \\ \hline \end{array}$$

4.
$$\begin{array}{r} 54,678 \\ + 7,123 \\ \hline \end{array}$$

5.
$$\begin{array}{r} 98,455 \\ - 9,770 \\ \hline \end{array}$$

6. $14,789 - 908 =$

7.
$$\begin{array}{r} 38,904 \\ - 9,878 \\ \hline \end{array}$$

8. $908 - 774 =$

9.
$$\begin{array}{r} 6,996 \\ - 456 \\ \hline \end{array}$$

Multiply and Divide Whole Numbers

Hints/Guide:

To multiply whole numbers, we must multiply the first number by one digit of the second number. The key is that when multiplying by each digit we must remember the place value of the number we are multiplying by:

$$\begin{array}{r} 534 \\ \times 46 \\ \hline 3204 \\ \underline{21360} \\ 24562 \end{array}$$

So we first multiply 534 by 6 to get 3204 (This is done by regrouping digits similar to adding, so $6 \times 4 = 24$, the 4 is written down and the 2 is added to the next product). Next, a zero is placed in the ones digit because when multiplying by the 4 in 46, we are multiplying by the tens digit, or 40. Next, we multiply 534×4 to get 21360. Finally, we add the two products together to get 24,564.

To divide whole numbers, we must know basic division rules are the opposite of multiplying rules. So if we know our times tables, we know how to divide (a review over the summer might not be a bad idea!). Since 3×4 is 12, then $12 \div 4 = 3$ and $12 \div 3 = 4$. Again, we deal with one digit at a time, so:

$$\begin{array}{r} 634 \\ 12 \overline{) 7608} \\ \underline{-72} \\ 40 \\ \underline{-36} \\ 48 \\ \underline{-48} \\ 0 \end{array}$$

First, we notice that 12 does not divide into 7, so we determine how many times 12 goes into 76. This is 6. Next, multiply 6×12 and place the answer, 72, under the 76 you have used. Now, subtract $76 - 72$ and place the 4 underneath the 72. Bring down the next digit from the number being divided, which is 0, and determine how many times 12 goes into 40. The answer is 3 and $3 \times 12 = 36$, so place 36 under the 40. Now, subtract $40 - 36$ and place the 4 under 36 and bring down the 8. 12 goes into 48 four times evenly, so there is no remainder in this problem.

Exercises: Solve:

No Calculators and show work!

1. $\begin{array}{r} 742 \\ \times 17 \\ \hline \end{array}$

2. $\begin{array}{r} 25 \\ \times 13 \\ \hline \end{array}$

3. $\begin{array}{r} 659 \\ \times 7 \\ \hline \end{array}$

9. $7 \overline{) 1463}$

10. $16 \overline{) 3840}$

11. $11 \overline{) 2211}$

12. $9 \overline{) 3789}$

Summer Mathematics Packet

Background of Fractions

Label the following fractional parts (circles) with the given fractions.

1 whole, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{6}$, $\frac{1}{8}$

Fraction Operations

Hints/Guide:

When adding and subtracting fractions, we need to be sure that each fraction has the same denominator, then add or subtract the numerators together. For example:

$$\frac{1}{8} + \frac{3}{4} = \frac{1}{8} + \frac{6}{8} = \frac{1+6}{8} = \frac{7}{8}$$

That was easy because it was easy to see what the new denominator should be, but what about if

it is not so apparent? For example: $\frac{7}{12} + \frac{8}{15}$

For this example we must find the Lowest Common Denominator (LCM) for the two denominators. 12 and 15

$$12 = 12, 24, 36, 48, 60, 72, 84, \dots$$

$$15 = 15, 30, 45, 60, 75, 90, 105, \dots$$

$$\text{LCM}(12, 15) = 60$$

So, $\frac{7}{12} + \frac{8}{15} = \frac{35}{60} + \frac{32}{60} = \frac{35+32}{60} = \frac{67}{60} = 1\frac{7}{60}$ Note: Be sure answers are in lowest terms

To multiply fractions, we multiply the numerators together and the denominators together, and then simplify the product. To divide fractions, we find the reciprocal of the second fraction (flip the numerator and the denominator) and then multiply the two together. For example:

$$\frac{2}{3} \cdot \frac{1}{4} = \frac{2}{12} = \frac{1}{6} \quad \text{and} \quad \frac{2}{3} \div \frac{3}{4} = \frac{2}{3} \cdot \frac{4}{3} = \frac{8}{9}$$

Exercises: Perform the indicated operation: **No calculators and show work!**

SHOW ALL WORK. Use a separate sheet of paper (if necessary) and staple to this page.

1. $\frac{1}{4} + \frac{3}{5} =$

2. $\frac{6}{7} + \frac{2}{3} =$

3. $\frac{2}{5} + \frac{8}{9} =$

4. $\frac{3}{4} - \frac{2}{3} =$

5. $\frac{2}{5} - \frac{2}{9} =$

6. $\frac{9}{11} - \frac{2}{5} =$

Add and Subtract Mixed Numbers

Hints/Guide:

When adding mixed numbers, we add the whole numbers and the fractions separately, then simplify the answer. For example:

$$\begin{array}{r} 4\frac{1}{3} = 4\frac{8}{24} \\ + 2\frac{6}{8} = 2\frac{18}{24} \\ \hline 6\frac{26}{24} = 6 + 1\frac{2}{24} = 7\frac{2}{24} = 7\frac{1}{12} \end{array}$$

$$\begin{array}{r} 7\frac{3}{4} = 7\frac{18}{24} \\ - 2\frac{15}{24} = 2\frac{15}{24} \\ \hline 5\frac{3}{24} = 5\frac{1}{8} \end{array}$$

First, we convert the fractions to have the same denominator, then add the fractions and add the whole numbers. If needed, we then simplify the answer.

Exercises: Solve in lowest terms: **No Calculators and show work!**
SHOW ALL WORK. Use a separate sheet of paper (if necessary) and staple to this page.

1.

9.
$$\begin{array}{r} 9\frac{2}{3} \\ - 6\frac{1}{4} \\ \hline \end{array}$$

10.
$$\begin{array}{r} 6\frac{3}{4} \\ - 5\frac{1}{5} \\ \hline \end{array}$$

11.
$$\begin{array}{r} 7\frac{1}{2} \\ - 3\frac{1}{4} \\ \hline \end{array}$$

12.
$$\begin{array}{r} 3\frac{1}{2} \\ - 2\frac{3}{10} \\ \hline \end{array}$$

Multiply Fractions and Solve Proportions

Hints/Guide:

To solve proportions, one method is to determine the multiplying factor of the two equal ratios. For example:

$$\frac{4}{9} = \frac{24}{x} \text{ since 4 is multiplied by 6 to get 24, we multiply 9 by 6, so } \frac{4}{9} = \frac{24}{54}.$$

Since the numerator of the fraction on the right must be multiplied by 6 to get the numerator on the left, then we must multiply the denominator of 9 by 6 to get the missing denominator, which must be 54.

Exercises: Solve (For problems 8 - 15, solve for N): **No Calculators and show work!**
SHOW ALL WORK. Use a separate sheet of paper (if necessary) and staple to this page.

1. $\frac{1}{5} = \frac{n}{20}$

2. $\frac{3}{n} = \frac{12}{28}$

3. $\frac{1}{n} = \frac{5}{25}$

4. $\frac{n}{4} = \frac{3}{12}$

5. $\frac{3}{7} = \frac{12}{n}$

6. $\frac{n}{9} = \frac{12}{27}$

7. $\frac{2}{3} = \frac{18}{n}$

8. $\frac{2}{7} = \frac{n}{21}$

Multiply and Divide Decimals

Hints/Guide:

To multiply decimals, the rules are the same as with multiplying whole numbers, until the product is determined and the decimal point must be located. The decimal point is placed the same number of digits in from the right of the product as the number of decimal place values in the numbers being multiplied. For example:

8.54 x 17.2, since $854 \times 172 = 146888$, then we count the number of decimal places in the numbers being multiplied, which is three, so the final product is 146.888 (the decimal point comes three places in from the right).

To divide decimals by a whole number, the process of division is the same, but the decimal point is brought straight up from the dividend into the quotient. For example:

$$\begin{array}{r} 17.02 \\ 3 \overline{) 51.06} \end{array}$$

The decimal point moves straight up from the dividend to the quotient.

Exercises: Solve: **No Calculators and show work!**
 SHOW ALL WORK. Use a separate sheet of paper (if necessary) and staple to this page.

1. $\begin{array}{r} 63 \\ \times .14 \\ \hline \end{array}$

2. $\begin{array}{r} .87 \\ \times 2.3 \\ \hline \end{array}$

3. $\begin{array}{r} 8.94 \\ \times 2.1 \\ \hline \end{array}$

4. $\begin{array}{r} 4.2 \\ \times .62 \\ \hline \end{array}$

5. $\begin{array}{r} 34.5 \\ \times 4.7 \\ \hline \end{array}$

6. $\begin{array}{r} 32.1 \\ \times .45 \\ \hline \end{array}$

7. $\begin{array}{r} 91.4 \\ \times 47 \\ \hline \end{array}$

8. $\begin{array}{r} 3.9 \\ \times 11 \\ \hline \end{array}$

9. $35 \overline{) 70.35}$

10. $7 \overline{) 25.83}$

11. $14 \overline{) 45.584}$

Reading Scales and Finding Area and Perimeter

Hints/Guide:

To determine the correct answer when reading scales, the important thing to remember is to determine the increments (the amount of each mark) of the given scale.

To find the perimeter of a rectangle or square, we must add the lengths of all of the sides together. To find the area of a square or a rectangle, we must multiply the length by the width.

Exercises:

1. Find the length of each line to the nearest inch:

2. Find the temperature in Celsius 3. Determine the amount of liquid in ml.

4. Find each area and perimeter:

Find the Average of a Set of Numbers

Hints/Guide:

To find the average of a set of numbers, we add together all of the numbers and then divide by how many numbers are in the data set. For example:

If the tests scores are 73, 87, 94, 84, 92, and 95, then we add the scores together: $73 + 87 + 94 + 84 + 92 + 95 = 525$, and since there are 6 numbers in the data set, we divide 527 by 6 and get the quotient of 87.5.

Exercises: **No Calculators and show work!**

SHOW ALL WORK. Use a separate sheet of paper (if necessary) and staple to this page.

For problem 1, use the following chart

Week	Monday	Tuesday	Wednesday	Thursday	Friday
1	65	68	72	74	68
2	68	75	80	68	75
3	75	74	69	79	80
4	80	82	76	67	79

1. Find the average (mean) temperature for:

Monday _____ Tuesday _____ Wednesday _____
 Thursday _____ Friday _____

2. If George has test scores of 85, 88, 92, and 87, what is his average (mean) score?

Challenge: Using the same test scores for George, what would his fifth test score need to be to have an average (mean) grade of 90?

3. If Tina's bowling scores were 120, 155, 145, 162, and 138, what was her average (mean) score?

Challenge: What would Tina's score need to be in the sixth game if she wanted an average over those six games of 145?
